

Take control of your field and your investment

Introducing the GroundControl™ II Planter Drive System from Elliott Manufacturing

Control input cost, even field edges, maximize crop yields, and cultivate precision farming better than ever before.

Elliott Manufacturing puts you in control with our new GroundControl II system, a direct plug-and-play drop in for John Deere ProSeries™ row units using RowCommand™. That means you can continue to benefit from your equipment investment for years to come. Our new GroundControl II system is a better, fully compatible, row control replacement for all Pro-Shaft™ driven row units, including both Pro-Series™ XP and MaxEmerge™ XP planters. What's more, Elliott's innovative design locates the clutch inside the seed meter gearbox, so you can use your existing flexible shafts for the fastest, easiest installation. Other features include:

- Non-indexing clutch offers optimal control of your seed meter to eliminate over-seeding, reduce seed waste, save money, and enhance crop output
- Option for manual or John Deere Section Control clutch engagement to pause seed distribution
- Reinforced knob with durable aluminum interface and self-locking screws stands up to harsh environments for maximum performance and life
- Easy to install for a fast and easy changeover
- Maintenance-free for uninterrupted performance
- Reverse-logic clutch draws 283mA of current only when slipping, so no major electrical enhancements are needed on your tractor
- Sealed design meets the IP-66 standard for water and dust ingress, and eliminates the potential of failure due to contamination

The Elliott GroundControl II planter drive system is the simple, affordable, and direct replacement for John Deere® RowCommand™.

Elliott's GroundControl II is a direct replacement for John Deere RowCommand™ systems on all Pro-Shaft™ drive planters. This smart, affordable solution will give you all the benefits you expect, along with significant savings in your budget.

Fast, simple installation and a lifetime of performance

Elliott's GroundControl II system incorporates your existing toolbar gearbox and flexshaft to quickly lock into place. The ergonomic knob design makes changeover lightening fast and almost effortless.

Elliott's proprietary knob is reinforced with self-locking set screws to optimize durability. The original plastic knob features spring fingers that snap into the seed meter shaft and can easily break. Our interface is reinforced aluminum, meaning you'll never have to buy another replacement knob.

With Elliott's GroundControl II planter drive solution, you can easily replace your RowCommand system and reap immediate results.
